1. INTRODUCTION

1.1 Executive Summary

The Redis Enterprise 6.x Security Technical Implementation Guide (STIG) is published as a tool to improve the security of Department of Defense (DOD) information systems. This document is meant to be used in conjunction with the Red Hat Enterprise Linux STIG (operating system STIG), network STIG, and other STIGs applicable to the database host environment. It is based on the Database Security Requirements Guide (SRG), which in turn derives its cybersecurity controls from National Institute of Standards and Technology (NIST) Special Publication (SP) 800-53, Revision 4.

Redis Enterprise is a real-time data platform built by Redis Labs, the same entity that developed open-source Redis. It maintains the simplicity and performance of Redis while adding enterprise-grade security, scalability, high availability, Active-Active geo-replication, and deployment options over multiple platforms on-premises, across clouds, and in hybrid deployments.

Redis is a NoSQL data store that maintains a key/value relationship in memory to achieve this performance. It can be used as a database, cache, or message store.

This STIG requires that the product be deployed on a FIPS-compliant, cryptography-enabled operating system found in the Cryptographic Module Validation Program (<https://csrc.nist.gov/projects/cryptographic-module-validation-program/validated-modules>) or by other means to ensure that FIPS 140-2-certified OpenSSL libraries are used by the database management system (DBMS).

Note: Failure to enforce FIPS 140-2 on the underlying OS will result in multiple findings for the RMF accreditation package. One finding, within the respective OS SRG or STIG, relates to how the OS communicates (security updates, privileged access, service accounts) as the underlying infrastructure. The second finding relates to how the application owner or DB administrator can establish secure communications and protect data. The OS and DB are independent resources, each with their own set of privileged users who may be accessing the platform for different reasons. However, the DB is not distributed with its own FIPS 140-2 crypto module (relying instead on the underlying OS); a misconfigured OS for FIPS 140-2 will result in two findings wherever Redis is installed.

1.2 Authority

Department of Defense Instruction (DODI) 8500.01 requires that “all IT [information technology] that receives, processes, stores, displays, or transmits DOD information will be [...] configured [...] consistent with applicable DOD cybersecurity policies, standards, and architectures.” The instruction tasks that DISA “develops and maintains control correlation identifiers (CCIs), security requirements guides (SRGs), security technical implementation guides (STIGs), and mobile code risk categories and usage guides that implement and are consistent with DOD cybersecurity policies, standards, architectures, security controls, and validation procedures, with the support of the NSA/CSS [National Security Agency/Central Security Service], using input from stakeholders, and using automation whenever possible.” This document is provided under the authority of DODI 8500.01.

Although the use of the principles and guidelines in these SRGs/STIGs provides an environment that contributes to the security requirements of DOD systems, applicable NIST SP 800-53 cybersecurity controls must be applied to all systems and architectures based on the Committee on National Security Systems (CNSS) Instruction (CNSSI) 1253.

1.3 Vulnerability Severity Category Code Definitions

Severity Category Codes (referred to as CAT) are a measure of vulnerabilities used to assess a facility or system security posture. Each security policy specified in this document is assigned a Severity Category Code of CAT I, II, or III.

Table 1-1: Vulnerability Severity Category Code Definitions

| Category | DISA Category Code Guidelines |
|----------|--|
| CAT I | Any vulnerability, the exploitation of which will directly and immediately result in loss of Confidentiality, Availability, or Integrity. |
| CAT II | Any vulnerability, the exploitation of which has a potential to result in loss of Confidentiality, Availability, or Integrity. |
| CAT III | Any vulnerability, the existence of which degrades measures to protect against loss of Confidentiality, Availability, or Integrity. |

1.4 STIG Distribution

Parties within the DOD and federal government's computing environments can obtain the applicable STIG from the DOD Cyber Exchange website at <https://cyber.mil/>. This site contains the latest copies of STIGs, SRGs, and other related security information. Those without a Common Access Card (CAC) that has DOD Certificates can obtain the STIG from <https://public.cyber.mil/>.

1.5 SRG Compliance Reporting

All technical NIST SP 800-53 requirements were considered while developing this STIG. Requirements that are applicable and configurable will be included in the final STIG. A report marked Controlled Unclassified Information (CUI) will be available for items that did not meet requirements. This report will be available to component authorizing official (AO) personnel for risk assessment purposes by request via email to: disa.stig_spt@mail.mil.

1.6 Document Revisions

Comments or proposed revisions to this document should be sent via email to the following address: disa.stig_spt@mail.mil. DISA will coordinate all change requests with the relevant DOD organizations before inclusion in this document. Approved changes will be made in accordance with the DISA maintenance release schedule.

1.7 Other Considerations

DISA accepts no liability for the consequences of applying specific configuration settings made on the basis of the SRGs/STIGs. It must be noted that the configuration settings specified should be evaluated in a local, representative test environment before implementation in a production environment, especially within large user populations. The extensive variety of environments makes it impossible to test these configuration settings for all potential software configurations.

For some production environments, failure to test before implementation may lead to a loss of required functionality. Evaluating the risks and benefits to a system's particular circumstances and requirements is the system owner's responsibility. The evaluated risks resulting from not applying specified configuration settings must be approved by the responsible AO. Furthermore, DISA implies no warranty that the application of all specified configurations will make a system 100 percent secure.

Security guidance is provided for the DOD. While other agencies and organizations are free to use it, care must be given to ensure that all applicable security guidance is applied at both the device hardening level and the architectural level due to the fact that some settings may not be configurable in environments outside the DOD architecture.

1.8 Product Approval Disclaimer

The existence of a STIG does not equate to DOD approval for the procurement or use of a product.

STIGs provide configurable operational security guidance for products being used by the DOD. STIGs, along with vendor confidential documentation, also provide a basis for assessing compliance with cybersecurity controls/control enhancements, which supports system assessment and authorization (A&A) under the DOD Risk Management Framework (RMF). Department of Defense AOs may request available vendor confidential documentation for a product that has a STIG for product evaluation and RMF purposes from disa.stig_spt@mail.mil. This documentation is not published for general access to protect the vendor's proprietary information.

AOs have the purview to determine product use/approval in accordance with (IAW) DOD policy and through RMF risk acceptance. Inputs into acquisition or pre-acquisition product selection include such processes as:

- National Information Assurance Partnership (NIAP) evaluation for National Security Systems (NSS) (<https://www.niap-ccevs.org/>) IAW CNSSP #11.
- National Institute of Standards and Technology (NIST) Cryptographic Module Validation Program (CMVP) (<https://csrc.nist.gov/groups/STM/cmvp/>) IAW Federal/DOD mandated standards.
- DOD Unified Capabilities (UC) Approved Products List (APL) (<https://www.disa.mil/network-services/ucco>) IAW DODI 8100.04.

2. ASSESSMENT CONSIDERATIONS

2.1 Security Assessment Information

While the STIG contents are classified as manual guidance, many checks and fixes include sample and/or actual code for executing the checks and fixes.

Additional guidance on configuring alerts and automating some aspects of operational control of the DBMS is provided in a supplemental document in the STIG package.

This guidance is but one component of a robust defense-in-depth strategy. As noted above, it is to be used along with the applicable operating system and network STIGs to provide comprehensive coverage of pertinent vulnerabilities. It is also necessary to train administrative and general users in the importance of good security practices.
